This proposal should not be approved.

The process in galvanizing is very toxic. You can hear all about how safe their process is. On the other hand it only requires one incident.

Could cause contamination on the ground, get into the natural under ground springs that helps supply some of our water. Toxic air fumes being moved by air current to residential areas, three schools, Boys and Girls Club, the baseball fields, soccer fields and all the businesses in that area. The air current usually comes from west to east across air field.

I don't think anyone would want their kids / family or neighbors to have to deal with exposure of incident. There is quite a few health issues that can come from exposure. Lead and zinc are pretty safe to handle if you use proper safety protection. It is when these are smelted into a liquid. That's when you get the vaporized fumes. Which can travel by air currents. Covers everything and able to breathe into your lungs and onto your skin. Harmful to animals.

Therefore I don't think this process should be approved. Doesn't matter what kind of revenue it will bring into this area. Think of what can happen. Nothing is 100 percent safe with toxic chemicals. Only takes once.

Thank you for this consideration,
